

(a) $p_F \approx 0.1$, one-sided signs; open, dashed: $\Phi^{-1}(u)$;
filled, solid: selection law at $z_{sh} + \chi_{M-1}^2$

(b) cells with $\rho^2 = 1$, $p_F \in [0.03, 0.97]$, $u = 0.01$
(cell count and k per M at bottom; not a paired sequence)

- unconditional $\Phi^{-1}(u)$
- selection law at z_{sh}
- selection law + χ_{M-1}^2
- x— empirical $X | F$ (reference)
